

iXIT Engineering Technology

Company Profile / Design, Development & Systems Integration

Who we are

iXIT Engineering Technology GmbH was founded in 2001 by Dr.-Ing. Michael Kaiser, former head of the "Engineering Systems" group at ABB Turbo Systems AG, Baden, Switzerland. The company is located in Karlsruhe, Germany, right in the centre of one of the most striving technology regions in Germany, enjoying close links to Germany's oldest Technical University and other innovative companies. From here, we work with our customers and deploy our solutions around the globe.

Our competence is based on business and process know-how that is relevant to our customers, and on detailed technical expertise in information technology and automation.

What we do

Our customers are successful in pharmacy, power generation, and process technology. Our mission is to enable them to improve quality, efficiency and pay back of their business processes that are related to product development, project execution, manufacturing, operation, maintenance and service.

Our core activities are

- Design, development, deployment and operation of systems supporting design, engineering, operation, maintenance and service processes
- Project management and technology & business process consulting for plant engineering, factory automation, plant operation & maintenance including asset management

Design, Development & Systems Integration

Our projects span a wide range of scope, platform, and technology. All of these are run by our certified architects and developers in the professional manner you expect from an engineering IT company. We cover the whole project life cycle from requirements analysis through design, development, automated testing, deployment, and customer training.

- **Scope:** We design and develop small, specific individual applications as well as large scale, distributed systems and also web-based applications. Especially, we work in systems' integration projects, connecting corporate systems from ERP through engineering tools and control systems.
- **Technology:** Depending on the customer's requirements, we work with state-of-the-art technology (Microsoft .NET, Java Enterprise Edition, Qt). However, we are at home in most environments used today by our customers, including, for example, C, C++, MFC, Visual Basic, Fortran 90, X-Windows, OSF/Motif, and all kinds of scripting. We work with all major databases, all major engineering tools and many control systems and can help you with your SAP, TeamCenter, and Navision integration project.
- **Platform:** We work with all Microsoft operating systems side-by-side with Linux and AIX.
